OPN-XS13-10LC2 / OPN-XS13-10LC2I

8.5Gb/s 1310 nm XFP Single-Mode Optical Transceiver for 8G FC Applications

PRODUCT FEATURES

- Up to 8.5 Gb/s Bi-directional Data Link
 - Complaint with XFP MSA
- Compliant with Fiber Channel FC-P1-4 800-SN-LL-I
 - Compliant with 4G, 2G Fiber Channel
 - 1310 nm DFB LD Transmitter
 - AC/AC Coupling according to MSA
 - 2 to 10,000 m at 8.5Gbps
- 2-Wire Interface for Integrated Digital Diagnostic Monitoring
 - XFI Loopback Mode
 - No reference Clock required
 - Power Consumption < 2 W
- Only Required +3.3 V Power Supply
 - RoHS Compliant
- 0 to 70°C Operating : OPN-XS13-10LC2
- -50 to 85°C Operating : OPN-XS13-10LC2I
 - Duplex LC Connector

APPLICATIONS

- Multi-rate 8x/4x/2x Fibre Channel

STANDARD

- Compliant with XFP MSA
- Compliant with 8GFC

PRODUCT DESCRIPTION

OPN-XS13-10LC2 series multi-rate 8G XFP transceivers are designed for serial optical data communications such as 8G Fibre Channel. It supports the 8.5Gbps transmission on 9/125 µm SMF.

The transceiver consists of two sections: The transmitter section consists of a directly modulated 1310 nm multiple quantum well DFB laser, driver and signal conditioner. The receiver section incorporates a PIN photodiode integrated with a trans-impedance preamplifier (TIA) and signal conditioner.

The module is with the XFP 30-pin connector to allow hot plug capability. Integrated Tx and Rx signal conditioners provide high jitter-tolerance for full XFI compliance and no external reference clock required. The internally ac coupled high speed serial I/O simplifies interfacing to external circuitry. Only single 3.3V power supply is needed. The optical output can be disabled by LVTTTL logic high-level input of TX_DIS. Loss of signal (RX_LOS) output is provided to indicate the loss of an input optical signal of receiver.

A serial EEPROM in the transceiver allows the user to access transceiver digital diagnostic monitoring and configuration data via the 2-wire XFP Management Interface. This interface uses a single address, A0h, with a memory map divided into a lower and upper area. Basic digital diagnostic data is held in the lower area while specific data is held in a series of tables in the high memory area.

Management Interface

The structure of the memory map is shown in Figure 1, which is accessible over a 2-wire serial interface at the 8-bit address 1010000X (A0h). The normal 256 byte I2C address space is divided into low and upper blocks of 128 Bytes. The lower block of 128 Bytes is always directly available and is used for the diagnostics and control function. Multiple blocks of memories are available in the upper 128 Bytes of the address space. These are individually addressed through a table select Byte which the user enters into a location in the lower address space. Thus, there is a total available address space of $128 \times 256 = 32$ Kbytes in this upper memory space. The contents of Table 01h are listed in Table 1 below. Please refer SFF INF-8077i (Revision 4.5) for detailed information.

1. Module ground pins GND are isolated from the module case and chassis ground within the module.
2. Shall be pulled up with 4.7K-10Kohms to a voltage between 3.15V and 3.45V on the host board.
3. These PINs are open within module.
4. A Reference Clock input is not required. If present, it will be ignored.
